

Activity 09 acceptance checklist

ACL and secure management

TGS-2023037854 | v7.0 | 110 minutes

Learner: _____ Date: _____

- ☐ 1. I built the compulsory simulator topology using the exact models, named ports and endpoint addresses.
- ☐ 2. I installed every peer baseline configuration and saved the CONFIGURED healthy baseline.
- ☐ 3. I observed the baseline traffic matrix on the simulator and captured actual show output.
- ☐ 4. I introduced the specified controlled fault and proved the affected and unaffected flows.
- ☐ 5. I applied the narrow repair and repeated the allowed, denied and failure/recovery tests where specified.
- ☐ 6. I rehearsed rollback from the saved healthy baseline and observed recovered traffic.
- ☐ 7. I calculated the relevant addressing, cost, tuple or policy results before editing fixtures.
- ☐ 8. I captured the original faulty fixture FAIL controls and explained their cause.
- ☐ 9. The corrected JSON fixture passes every contract; self-test rejects faulty and corrupted controls.
- ☐ 10. I distinguished fixture calculations from actual simulator results and recorded unsupported advanced features honestly.
- ☐ 11. I submitted the verified .pkt file, actual show/traffic evidence, corrected case.json and diagnosis.

Evidence note

The core simulator construction is compulsory. Separately labelled unsupported extensions may be evidence-only. Fixture PASS does not prove live forwarding, authentication or deployment.

Trainer / peer review: _____

Actual simulator acceptance tests

PC1 Command Prompt: ssh -l learner 10.10.10.1 (include a space between username and address) and enter the isolated training password from the R1 block; expect User EXEC prompt and a privilege-limited session. PC2 ssh -l learner 10.10.10.1 must fail because the VTY ACL permits only 10.10.10.10. PC1 telnet 10.10.10.1 must fail. Both directions ping remain permitted. R1 show access-lists MGMT-SOURCES shows permitted/denied counters; show ip ssh shows version 2. If PT rejects inline modulus, use crypto key generate rsa and answer 1024 to the prompt. Production exercise uses 2048+ where supported.

☐ Healthy baseline observed ☐ Controlled fault observed ☐ Repair verified

Observed outcomes / differences: _____

Fixture acceptance controls

- ☐ ACL first-match flow matrix
- ☐ SSH only and bounded session
- ☐ AAA client and server roles
- ☐ tested local fallback
